                                                                                                                                                                                                                                                                                                            The present sequence represents a DNA sequence encoding the heavy chain variable region of primate monoclonal antibody anti-buman CD23 dGS. The invention provides primate monoclonal antibodies which specifically bind human CD23, the low affinity receptor for IGE (FceRii/CD23), and comprise either of a human gamma-1 or human gamma-3 constant region that binds to human Fc gamma receptors and inhibits IGE expression. The monoclonal antibodies of the invention are claimed to be useful for inhibiting induced IGE production for treating or preventing for inhibiting and autoimmune conditions e.g. allergic rhinitis conjunctivitis, autoimmune hasmolytic anaemia, etc. (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAW01821 and AAW01822) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antigen moncolonal antibody 16C10. Cloned 16C10 ight and heavy variable genes are inserted into an expression vector (pref. NBOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monkey monoclonal antibody binding human B7.1 or B7.2 antigen -useful for treating autoimmune disease or graft-versus-host disease
                                                                                                                                                                                                                                                                                                                                                                  Primatised anti-human B7.1 antigen antibody 16C10 heavy chain DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           70.0%; Score 256.2; DB 18; Length 1431; 82.2%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence encodes a primatized form of the antibody 16C10 heavy chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (Mab's) that bind selectively to 87.1 (CD80) or to 87.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving 1 cell/B cell interactions, particularly autoimmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel disease, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours Optionally the MAb can be conjugated to a during or toxin. MAb's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop

anti-idiotype reagents. MAb's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunoglobulin G (IgG) responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 237

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   301 TGGGCCCAAATAGCTGGAA---CAACGCTAGGCTTCTGGGGCCCAGGGAGTCCTGGTCACC 357
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides an antibody (Ab) comprising donor CDRs (complementarity determining regions) derived from a non-human antigenspecific donor antibody, and an acceptor framework from a non-human primate. The Abs are prepared by grafting CDRs from a non-human human specific donor antibody onto homologous Old World ape or monkey acceptor frameworks. The Abs have reduced immunogenicity and are better tolerated in humans (because of the close similarity between the human and primate process), but retain the full antigen-binding affinity of the donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cedescracesreccaecarearscrrrrearrirciesesceaacecreaescreaesc

They can be used to provide novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4, CE9 gamma-4E and CE9 gamma-4PE, in which the human 19G4 Fc binding domain framework is combined with the antigen binding domains (see also AAW14922-23) of macaque anti-human CD4 monoclonal antibody E9.1. These antibodies show high affinity to human CD4, have little or no immunogenicity in humans and show reduced or absence of effector function. The

DNA sequences (AAT62868-70) respectively code for the heavy chain regions of human gamma-4 (AAM14925), gamma-4E carrying the L236E mutation (AAM14926) and gamma-4PE (AAM19297) carrying L236E and S22 mutations. They can be used to provide novel monoclonal and chimeric antibodies, e.g. CE9 gamma-4, CE9 gamma-4E and CE9 gamma-4PE, in which the human IgG4 Fc binding domain framework is combined with the antigen binding domains (see also AAM14922-23) of macaque anti-human CD4 monoclonal antibody E9.1. These antibodies show high affinity to human CD4, have little or no immunogenicity in humans and show reduced or absence of effector function. The gamma-4E and -4PE mutations confer activity enhanced stability and eliminate depleting activity. The antibodies can be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleotide sequence of antibody directed against K293 superantigen.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention provides a binding structure, such as an antibody, binding to tumor cells, especially epithelial tumor cells such as colorectal, pancreatic, breast or lung carcinoma cells. The binding structures, target structures to the binding structures or the substances, i.e. antisense oligonucleotides and ribozymes, are useful in the therapy and in vitro histopathological diagnosis and prognosis of human malignant disease. The present sequence represents the nucleotide sequence of antibody directed against K293 superantigen.

                                       The sequences given in AAQ35903-04 encode the Simian anti CD4 VH and V-lambda sequences respectively. These sequences were derived using the primer sequences given in AAQ35901-02. The amplification products were sequentially cloned into the vector TCAE 6, which contains human 1961 and human lambda constant regions. The amplified sequences could human, chimpanzee or old world monkey immunoglobulin (1g) constant region and an antisped May binding portion of an old world monkey if a varible region, where the old world monkeys may be the same or different. The recombinant antibody may be used as a therapeutic agent for the treatment of rheumatoid arthritis, eczema and immunological disorders.

The present sequence encodes an anti-CD4 cynomolgus monkey Ig heavy chain variable region. An anti-CD4 antibody (Ab) comprising the light- and heavy-chain variable regions encoded by the present sequence and that of AA791565 is also new. The Abs are useful for human therapy, especially of tumours. Old world monkeys are sufficiently different from humans to allow Abs against human Ags, even relatively conserved Ags such as CD4 and CD54, to be raised in these nonkeys, and are sufficiently similar to humans to avoid host anti-Ab immune responses when the Abs are introduced into humans. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                This DNA encodes the heavy chain variable region (VH) of the cynomolgus monkey anti-CD4 antibody. The antibody comprises antigen-binding sequences from an Old World monkey antibody and human constant domain sequences. The antibody specifically binds to CD4 and can be used in the treatment of rheumatoid or psoriatic arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the coding sequence for the heavy chain variable region from an anti-human CD4 immunoglobulin raised in compromodius monkeys. The sequence was PCR amplified and used in the construction of a recombinant antibody comprising: (i) an Old World monkey Ig antigen-binding region, and (ii) a human or chimpanzee Ig constant region. The hybrid antibodies can be used as passive or active therapeutic agents against human diseases, e.g. B-cell lymphoma, AIDS, autoimmune and inflammatory diseases, transplant rejection or tumours, or for producing therapeutic and diagnostic conjugates. Although evolutionary distant monkeys are used to raise antibodies against human antibodies, such that that they produce antibodies similar to human antibodies, such that when the monkey antibodies are introduced into humans, no host anti-antibody response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 cadericcadericcadeadededececeadaericereaadeerreedadeereere

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a recombinant antibody comprising a human, chimpanzee or a first old World monkey immunoglobulin constant region, and an antigen-binding portion of a second old World monkey immunoglobulin variable region. The first and second old World monkey treating a be the same or different. The recombinant antibody is useful for treating a human having the antigen described above, e.g. for treating cancer in a human having a tumour antigen, or for treating a human sutoimmune response (where the antigen is involved in an autoimmune response in the human). In particular, the recombinant antibody is useful for treating theuman). In particular, the recombinant antibody is useful for treating theumaniant, prenametory disease. The recombinant artibody is also useful for treating twours, leukaemia, lymphoma, Hashimoto's thyroiditis, autoimmune carditis, Addison's disease, type I-diabetes mellitus, multiple sclerosis, male infertility, autoimmune hemolytic anaemia, inflammatory bowel disease, Sjogren's syndrome, psoriasis, or systemic impune stythematosus. This is the amino acid sequence of a monkey immune carditish heavy variable chain polypeptide for creation of the

The present sequence for human diagnostic and therapeutic (dithp) cDNA sequence #37 is 1 of 71 (AAS03012-AAS03082) novel sequences described in the invention. The present sequence (Incyte ID No: 4442487dec) cancedes an antigen recognition molecule. The dithp polymucleotides may be used to diagnose a condition disease or disorder associated with human molecules. They can be used to identify the presence of similar nucleic acids. Dithp polymucleotides may used to generate hybridisation probes for use in chromosomal mapping. Polypeptides (DITHP) encoded by dithp are used to screen for molecules which bind to them and modulate their activity. Dithp polymucleotides can be used for gene therapy of disorders such as severe combined immunodeficiency syndrome (SCID), cystic fibrosis, thalassemia, haemophila resulting from Factor VIII cystic fibrosis, thalassemia, haemophila resulting from Factor VIII hypercholesterolaemia (FH), cell proliferative disorders e.g. cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neurodegenerative disorders, autoimmune/inflammatory disorders,
infectious disorders and developmental disorders. The antibodies can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 11,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                     366

  The present sequence represents a DNA sequence encoding the heavy chain variable region of primate monoclonal antibody anti-human CD23 5E8. The invention provides primate monoclonal antibody anti-human CD23 5E8 bind human CD23, the low affinity receptor for IgE (FCeRii/CD23), and comprise either of a human gamma-1 or human gamma-3 constant region that binds to human Fc gamma receptors and inhibits IgE expression. The monoclonal antibodies of the invention are claimed to be useful for inhibiting induced IgE production for treating or preventing for inhibiting and autoimmune conditions e.g. allergic rhinitis conjunctivitis, autoimmune hameolytic anaemia, etc.

  The present invention relates to novel human monoclonal antibodies. The antibodies can bind to human Tumour Growth Factor-beta (TGF-beta) II receptor, resulting in the inhibition of the signal transduction of human TGF-beta into cells. The antibodies can be used for the prevention and treatment of diseases associated with the production of TGF-beta, such as tissue fibrosis in the lung, liver, skin, kidney or other tissues, atherosclerosis, atopy, keloid and arthritis. The present sequence was

  The invention relates to screening an antibody against a specific protein in an objective structure sample containing a protein group in high efficiency, comprising reacting an objective structure sample containing a protein group or a portion containing an objective protein in the sample with an antibody library, recovering the antibody combined with the protein, replicating the recovered antibody and reacting it with the objective protein at least once. The method is used for the identification of an objective protein. The present sequence is a DNA sequence for an antibody chain (derived from the DP47 heavy chain, the DPK22 light chain or a combination of the two) used in the method of

   The specification describes a method for screening for functional polypeptides which bind a ligand. The method comprises contacting a repertoir of polypeptides with a generic ligand, and then screening selected functional polypeptides with a target ligand. The method permits the removal from a chosen repertoire of polypeptides, those which are non-functional, e.g. as a result of the introduction of frame-shift mutations, stop codons, folding mutants or expression mutants which would be or are incapable of binding to any target ligand. The method also permits the enrichment of a chosen repertoire of polypeptides for those polypeptides which are functional, well folded and highly expressed. The polypeptides obtained can be used in

The present invention describes a dual-specific ligand (I) comprising:

(a) a first single immunoglobulin variable domain with a binding specificity to a first antiate antiable domain with a binding complementary immunoglobulin single variable domain with a binding activity to a second antigen or epitope. The binding domains are mutually complementary, and the first and second domains lack mutually complementary domains that share the same specificity. (I) has cytostatic, anti-HIV, antianaemic, antiinflammatory, immunosuppressive and neuroprotective activities. The dual-specific ligand is useful for treating, preventing or diagnosing clisamsations or autoimmune disorders (e.g. multiple sclerosis, Crohn's disease or myasthenia gravis). The dual-specific ligand may be used to recruit cytotoxic T-cells to a cancer cell. The dual-specific ligand is also useful for monitoring the efficacy of drugs, as well as for monitoring toxicity. The present sequence encodes a human serum albumin (HSA) related antibody sequence, which is used in an example from the
   Dual-specific ligand having immunoglobulins with binding specificity different antigens or epitopes, useful for treating, preventing or diagnosing diseases, e.g. cancer, HIV infection, inflammations, or

Human KDR (VEGFR-2) Fab heavy chain (VH) DNA from D2C6 clone.

Human; tumour; vascular endothelial growth factor receptor; metastasis; epidermal growth factor receptor; non-small cell lung carcinoma; NSCLC; breast; VEGFR; heart; EGFR; therapy; invasiveness; heavy chain; gene; VH; ds.

The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone marrow, blood, thymus, uterus, testicles, cervix or liver) over expresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, preferably useful for treating subjects with both solid tumours. The inhibition or reduction of tumour growth includes prevention or inhibition of the progression of tumour includes the invasiveness, metastasis, recurrence and increase in size of the tumour. The present sequence is human KDR (VEGFR-2) Fab antibody heavy chain DNA. 120 61 TCCTGTGCAGCCTCTG----GATTCACCTTCAGTAGCTATAGCATGAACTGGGTCCGC 114 121 CAGGCTCCAGGGCAGGGCTGGAGTGGGTCTCACGTATTAGTAGTAGTGGTGATCCCACA 180 181 TGGTACGCAGACTCCGTGAAGGGCAGATTCACCATCTCCAGAGAGGAGGCCAACAACACA 240 115 cadgerceaegeaaegegeregagreegrerearcearragragragragragracara 174 9 Inhibiting tumor growth in humans involves administering vascular endothelial growth factor receptor antagonists in combination with radiation, chemotherapeutic agents, or epidermal growth factor receptor 1 caccinecacinecidente and increased and contract and contractions of the contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract and contract 1 GAGGTGCAGCTGGTGGAGTCTGGGGGGCGCTTGGCAAAGCCTGGGGGGTCCCTGAGACTC TGGTGCGCAGCCTCCGGGTTCAGGTTCACCTTCAATAACTACTACATGGACTGGGTCCGC /product= "Human KDR (VEGFR-2) Fab heavy chain (VH) /note= "CDS does not include start and stop codon" 9 DB 24; Length 348; Indels Sequence 348 BP; 82 A; 85 C; 105 G; 76 T; 0 other; 26; Score 238.4; DB 24 Pred.    The invention relates to a novel method for screening an antibody, comprising performing 2-D electrophoresis on plural proteins in a sample. Individual protein spots are separated by reacting them with an antibody library and then replicating the bound antibodies before reacting them with the spot proteins again. The method is useful for screening an antibody specific for a target protein, e.g. from a phage antibody library, which is useful in proteomics for studying various protein and complementary deoxyribonucleic acid (cDNA) expression libraries as well as gene functions, and in other biological and medical sciences. This polymucleotide is a DNA sequence relating to the antibody screening

The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone marrow, blood, thymus, uterus, testicles, cervix or liver) over expresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours, preferably high vascular tumours and non-solid tumours. The inhibition or reduction of tumour growth includes prevention or inhibition of the progression of tumour including cancerous and non-cancerous tumours, where the progression of tumours includes the invasiveness, metastasis, recurrence and increase in size of the tumour. The present sequence is human KDR (VEGFR-2) Fab antibody heavy chain DNA.

The invention relates to a novel antibody having a first antigen binding site specific for a first vascular endothelial growth factor (VEGF) receptor and a second antigen-binding site specific for a second VEGF receptor. The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This polynucleotide sequence represents a human DNA sequence relating to the bispecific antibodies that bind to the VEGF receptors of

```
The invention relates to a method of inhibiting tumour growth which involves administering, vascular endothelial growth factor receptor (VEGFR) antagonists in combination with radiation, chemotherapeutic agent, or epidermal growth factor receptor (EGFR) antagonist. The method is useful for inhibiting tumour growth in a human, where the tumour (e.g. tumour of the breast, heart, lung, small intestine, colon, spleen, bone, kidney, bladder, head and neck, ovary, prostate, brain, pancreas, skin, bone marrow, blood, thymus, uterus, testicles, cervix or liver) over cxpresses VEGFR. It is also useful for inhibiting growth of colon tumour or non-small cell lung carcinoma (NSCLC) and tumour overexpressing EGFR. It is preferably useful for treating subjects with both solid tumours. The inhibition or reduction of tumour growth includes prevention or inhibition of the progression of tumour including cancerous and non-cancerous tumours, where the progression of tumours includes the invasiveness, metastasis, recurrence and increase in size of the tumour. The present sequence is human KDR (VEGFR-2) Fab antibody heavy chain DNA.
